What is API security?

API security is the practice of protecting application programming interfaces (APIs) from malicious attacks, misuse, and unauthorized access. APIs have become an essential part of modern applications, and as such, they can expose critical business data, making them an attractive target for attackers. At Ammune.ai, we specialize in **robust API security solutions** to mitigate this risk.

Why is API security important?

API security is important because APIs, being gateways to application data and services, can be exploited by attackers if not adequately protected. At Ammune.ai, we understand the importance of secure APIs and our solutions are built to safeguard these essential components from a wide range of threats.

What does your API security solution offer?

Our flagship product, Ammune™, offers a comprehensive, self-learning, AI-driven security solution. It protects from malicious content attacks (log4J, SQLi, etc.), bot attacks (credential stuffing, data scraping, etc.), applicative DDoS attacks, and business logic attacks by users. Ammune™ protects such attacks made by humans, scripts (automated machines) and AI algorithms.

How does your solution identify and mitigate potential API threats?

Ammune™ developed a state-of-the-art AI technology, adapted to the specific needs of API cyber security. It combines attack principles knowledge, which is applied with ML algorithms adapted to cyber security, allowing quick detection by identifying threats and anomalies on the spot, automatically and act in real-time to mitigate threats.

We offer different pricing models based on the size and complexity of your API environment. We recommend you contact our sales team for a customized quote that fits your business requirements.

Can we test your API security solution before purchase?

Certainly. We believe in our product and its capabilities; hence we offer a free trial, so you get a first-hand experience of our platform's robust security capabilities.

How is your solution different from other API security products on the market?

Ammune™ is known for its high reliability. Reliability is made possible due to two factors. First, Ammune™ rarely results in cases of false positives (mistakenly identifying normal traffic as malicious) or false negatives (mis-identification of attack). Ammune™ protects from API attacks made by humans, scripts (automated machines), or AI algorithms. Second, Ammune™ operates in demanding production environments – primarily for enterprise customers – for years, with no unexpected downtime. It is modest in its CPU and memory consumption, which remain stable no matter the volume of traffic.

Can your solution handle both REST and SOAP APIs?

Absolutely. Ammune™ is designed to provide robust security to both REST and SOAP APIs. This ensures comprehensive coverage for your entire API landscape.

Is your API security solution cloud-agnostic?

Yes, Ammune™ can be deployed in any cloud environment – AWS, Azure, Google Cloud, or a private cloud. This provides you with the flexibility and adaptability needed for modern infrastructures.
