

API Security Solution Comparison

Immune.AI

 **Cequence**

 **wallarm**

Overview

Ammune.ai is a next-gen company, and the first to take a **complete, proactive approach** to API Security. Ammune.ai **covers the entire scope of API security — discovery, posture management and runtime protection**. Ammune.ai is privately held, remote-first with headquarters in **New York**.

Ammune.ai's core capability is ensuring API security by creating **air-gapped environments** (e.g., using machine learning models that update periodically without internet access) to establish technical competence and innovation.

Detailed Solution Comparison

SECURITY APPROACH

Feature	Ammune.ai	Cequence	Wallarm
Core Focus - AI-driven API Security	AI-driven API security with real-time anomaly detection	API security, bot mitigation, and application security	API and application security with ML-based attack detection
Detection Method - Autonomous AI Learning	Unsupervised AI learning for behavioural anomaly detection	ML-based detection with API risk scoring	ML-based WAF and API security with automated security policies
Zero-Day Protection - Extent of Threat Detection	Strong, detects unknown threats based on behaviour	Moderate, relies on predefined threat models	Moderate, uses ML for known and emerging threats

DEPLOYMENT & INTEGRATION

Feature	Ammune.ai	Cequence	Wallarm
Deployment Model - Public Vs Private Infrastructure	Cloud-native, Private SaaS, and on-prem	SaaS and on-prem	SaaS, hybrid, and self-hosted options
Ease of Integration - Platforms Supported	Seamless with Kubernetes, microservices, and API gateways	Requires more configuration, integrates with CI/CD pipelines	Strong Kubernetes support but requires manual tuning
Multi-Cloud Support	Yes	Yes	Yes

PERFORMANCE & AUTOMATION

Feature	Ammune.ai	Cequence	Wallarm
Response Rate - Real-Time Response	Sub-second detection & mitigation	Moderate, uses API risk scoring before action	Moderate, mitigates based on predefined rules
Level of Intervention - Automated Remediation	Yes (self-learning, adaptive)	Yes, but requires manual fine-tuning	Yes, ML-assisted policy creation
Level of Accuracy - False Positives	Low due to a behavioural AI model	Moderate due to rule-based detection	Moderate, requires tuning

API DISCOVERY & PROTECTION

Feature	Ammune.ai	Cequence	Wallarm
Level of Automation - API Discovery	Yes (AI-driven, automatic)	Yes (automated API inventory)	Yes (passive discovery via traffic analysis)
OWASP - API Security	Fully covered, detects business logic abuse	Covers most risks but lacks real-time adaptive learning	Covers OWASP risks but focuses on predefined attack patterns

COMPLIANCE & ENTERPRISE READINESS

Feature	Ammune.ai	Cequence	Wallarm
Compliance - API Discovery	Fully compliant, supports enterprise needs	Compliant but less focused on enterprise-specific needs	Compliant but focused on API security

COST & VALUE

Feature	Ammune.ai	Cequence	Wallarm
Convenience - Pricing Model	Fixed cost, flexible private SaaS auto-scaling	Subscription-based, expensive for large enterprises	Subscription-based, competitive, but requires manual setup
Cost Effectiveness - TCO (Total Cost of Ownership)	Lower due to automation & AI-driven detection	Higher requires human intervention	Moderate, but requires tuning

Key Takeaways

- » **Ammune.AI:**
Best for enterprises looking for AI-driven, real-time API security with zero-day attack protection and low false positives.
- » **Cequence:**
Good for companies needing bot mitigation alongside API security, but relies on risk scoring rather than real-time AI.
- » **Wallarm:**
Strong for API and web application security, but less automated and requires manual configuration.

If you think Ammune.ai is the right API security partner for your business, reach out to us:
