Runtime Protection

One of the most unique and complex properties of APIs is that usage patterns differ greatly depending on the functionality of the API. To adequately detect malicious traffic during runtime, you need to successfully differentiate between normal and abnormal behavior.

Product Brief

Why you need API Runtime Protection

Runtime Protection detects the most complex API business logic-based attacks like BOLA – where the incoming request demands access to objects which do not match the authenticated client – and blocking attacks in real-time. Successful Runtime Protection is based on differentiating normal versus abnormal behavior.

Ammune.ai API Runtime Protection

Ammune.ai employs unsupervised offline Machine Learning to perform anomaly detection based on historical behavior on a per-API basis. We first learn the expected behavior of each API endpoint and, subsequently, evaluate each additional request against the baseline to detect outliers indicating malicious intent.

By using Ammune.ai API Runtime Protection, you can:

Reduce risk by stopping attacks immediately

Reduce costs by identifying and remediating vulnerabilities before exploitation

Reduce lost revenue from downtime

Enhance compliance with regulatory requirements and internal policies

Product Brief

The screenshot displays the Ammune.ai Security dashboard. The top navigation bar includes 'noname', 'Security', 'Inventory', 'Report', and 'Testing'. The left sidebar shows a search bar and a tree view with 'Root' and several 'Group Item' entries. The main content area is divided into two sections: 'Attackers' and 'Attacker Details'.

The 'Attackers' section contains a table with the following data:

Identifier	Identifier Type	Risk
1234-1234	User ID	High
1234-1234	IP Address	High
1234-1234	IP Address	High
1234-1234	IP Address	Medium
1234-1234	IP Address	Medium
1234-1234	IP Address	Low
1234-1234	IP Address	Low
1234-1234	User ID	Low
1234-1234	User ID	Low
1234-1234	User ID	Low
1234-1234	User ID	Low
1234-1234	User ID	Low
1234-1234	User ID	Low
1234-1234	User ID	Low

The 'Attacker Details' section shows the details for the selected attacker (1234-1234). It includes a 'Block Attacker' button and the following information:

- Attacker Information:** Identifier: 1234-1234
- Identifier:** 1234-1234
- Identifier Type:** User ID
- Risk:** Medium
- Issues:** 10 (High), 5 (Medium), 1 (Low)
- Open Issues:** 17
- IPs:** 1234-1234
- Location:** Germany +3
- Last Attempt:** Thu May 12 2022 13:22:55
- Attempts:** 12
- Is Blocked:** False

The 'Issues' section contains a table with the following data:

Module	Type	Country	IP	Severity	Detection Time	Status
Posture	Path Traversal	United Kingdom	1.1.1.1, 2.1.1.1	High	2022-01-12 11:18	Oper
Posture	Path Traversal	US	1.1.1.1	Medium	2022-01-12 11:18	In Pr
Posture	Path Traversal	Australia	1.1.1.1	Low	2022-01-12 11:18	False
Posture	Path Traversal	China	1.1.1.1	Low	2022-01-12 11:18	False
Posture	Path Traversal	China	1.1.1.1	Low	2022-01-12 11:18	False

Remediation

Once the Runtime Protection module identifies a malicious user, we offer the possibility to either manually or through automated policies block the active attacker while simultaneously identifying the root cause so future exploitation can be avoided.

Product Brief

About Ammune.ai

Ammune.ai is the only company taking a complete, proactive approach to API Security. Ammune.ai works with 20% of the Fortune 500, and covers the entire API security scope — Discovery, Posture Management, Runtime Protection, and API Security Testing. Ammune.ai is privately held, remote-first with headquarters in Silicon Valley, California, and offices in Tel Aviv and Amsterdam.
