Security Testing

API Security Testing goes a long way in avoiding API breaches by preventing security vulnerabilities from ever reaching production environments. Ammune.ai Active Testing focuses on finding and remediating API security vulnerabilities during the development phase of the SDLC, before they can be exploited.

Product Brief

Why you need API Security Testing

The earlier you catch security vulnerabilities, the better. From both a cost perspective and remediation angle, it is much easier to correct issues during the development process of the API than after it has been released into production and is in active use. It allows organizations to confidently and efficiently deliver applications to the business and remain competitive securely.

Ammune.ai API Security Testing

Ammune.ai ensures that no API is left untested. We brought years of experience in production API security over to a pre-production solution to uncover sophisticated API security vulnerabilities using API-specific tests, resulting in findings commonly missed by existing DAST solutions. Our world-class auto-reachability ensures all pieces of the API endpoints are sufficiently tested for vulnerabilities and remediations presented. Active Testing seamlessly integrates with existing developer workflows using CI/CD tooling to avoid unnecessary workflow changes or delays in testing for API security.

Using Ammune.ai Active Testing, you can:

Reduce remediation costs by 10x to 100x by finding issues earlier

Reduce refactoring costs

Improve code quality without sacrificing speed

Increase revenue by accelerating time to market

Product Brief

Remediation

Security vulnerabilities exposed through Active Testing will automatically be exposed to the development team either during the build process or via integrations with tools like Jira. With vulnerabilities exposed in context, developers can efficiently remediate issues immediately instead of refactoring after sensitive data has been put at risk or exploited.
